Conligo Pay

The Best in ERP-integrated Payments

Conligo Pay (formerly known as Iciniti Credit Card) allows you to integrate payments into your ERP system with the solution that supports more payment gateways than any other product in the Sage 300 family. Eliminate manual processes while avoiding cumbersome reconciliations and automating your cash-to-order process. The PA-DSS compliant Conligo Pay will get you paid faster while reducing your PCI responsibilities.

Payments made Easy!

WHY CHOOSE US?

EFFICIENCY

Sage 300 and other ERP batching and individual authorization entry for orders, and payment entry for invoices.

EASE OF USE

Reports to show authorizations awaiting capture, failed authorizations/captures, cards soon to expire, etc. No custom Sage 300 Order Entry module. All payments are done through **Conligo Pay** module.

SUPPORTS

Multiple cards on file. Cards can be sorted in a preferential sequence rather than just marking a single preferred card for the transaction.

GREAT SERVICES

-  Receipts are entered automatically against posted invoices.
-  Configure receipt batches by card type, or multiple card types in one batch.
-  Automatically add flat amount or percentage to total to be authorized.
-  Search feature for customers who have a lot of cards on file (e.g. national accounts).

Multi-Gateway Support

Conligo Pay integrates seamlessly into your gateway and processor of choice. We will never force you to work with a specific gateway or limited range of gateways. Conligo Pay also features the ability to support multiple merchant accounts under the same gateway (e.g. one account for USD, another for CAD).

Conligo Pay Security

With **Conligo Pay**, all credit card numbers are entered externally from your ERP system. The credit card data is double tokenized and stored either on your payment gateway or Conligo Card Safe Token Vault, with only the new generated token returned to the ERP system. The PCI-valued data is isolated only to the gateway or Conligo Card Safe Token Vault, removing the need to keep a separate PCI-compliant server.

Using the **Conligo Card Safe Token Vault** provides military-grade security with the flexibility to move to any gateway or processor of choice.
